### Research Summary

A pulmonary artery catheter, also known as a Swan-Ganz catheter, is a medical device used for measuring various cardiovascular parameters within the heart and pulmonary arteries. It consists of a long, thin tube with an inflatable balloon at its tip. The catheter is typically inserted through a large vein, often the internal jugular or subclavian vein, and advanced into the right side of the heart and pulmonary artery. Once in place, the balloon can be inflated and floated into the pulmonary artery to monitor pressures in the heart and lungs. Pulmonary artery catheters provide critical information about cardiac output, pulmonary artery pressure, central venous pressure, and other hemodynamic parameters. While they were once widely used in various clinical settings, their use has become more selective due to concerns about complications and the availability of alternative monitoring methods.

The major global manufacturers of Pulmonary Artery Catheter include Edwards Lifesciences Corporation, Argon Medical, ICU Medical, Biosensors International, BD, etc. The global players competition landscape in this report is divided into three tiers.
