### Research Summary

Quantum Key Distribution (QKD) is a groundbreaking technology in the field of quantum cryptography that enables secure communication by exploiting the principles of quantum mechanics. In the QKD process, cryptographic keys are exchanged between two parties, traditionally named Alice and Bob, using quantum properties such as superposition and entanglement. The security of QKD relies on the fundamental quantum principle that any attempt to eavesdrop on the quantum states of particles used for key exchange will inevitably disturb the system, alerting the communicating parties to the presence of a potential adversary. This unique feature ensures the creation of secret keys with a level of security that is theoretically unattainable through classical cryptographic methods. QKD addresses the threat of quantum computers, which could potentially break traditional cryptographic algorithms, offering a quantum-safe solution for establishing secure communication channels in the era of quantum computing.

The major global suppliers of Quantum Key Distribution (QKD) include ID Quantique,

Quintessence Labs, MagiQ Technologies, Toshiba, QuantumCTek, Qasky, Qudoor, etc. The global players competition landscape in this report is divided into three tiers.
