Research Summary

Radial head prostheses are orthopedic implants used in the replacement of the radial head, which is the part of the radius bone located near the elbow joint. These prostheses are employed in cases where the radial head has been severely damaged due to trauma, fractures, or degenerative conditions. The implant typically consists of metal components, such as stainless steel or titanium alloys, and may include a polyethylene or metal head that articulates with the ulna and humerus bones. Radial head prostheses aim to restore joint function, stability, and range of motion while minimizing pain and improving overall joint mechanics. The selection of a radial head prosthesis is based on factors such as the extent of damage, patient anatomy, and the surgeon's judgment. These prostheses are integral in orthopedic surgery for addressing complex elbow injuries and conditions that impact the radial head.

The major global manufacturers of Radial Head Prostheses include DePuy Synthes, Wright Medical Group, Zimmer Biomet, Smith & Nephew, Acumed, Adler Ortho, implantcast, Skeletal Dynamics, ChM, Beznoska, In2Bones, etc. The global players
