Research Summary

Radiation-curable coatings are a type of coating material that undergoes polymerization and curing when exposed to ultraviolet (UV) or electron beam (EB) radiation. These coatings typically consist of monomers, oligomers, and photoinitiators. When subjected to UV or EB radiation, the photoinitiators undergo a process that initiates the polymerization of the monomers and oligomers, leading to the formation of a solid and durable coating. Radiation-curable coatings are known for their fast curing times, allowing for quick and efficient processing in various industrial applications. They are commonly used in industries such as printing, packaging, wood finishing, and electronics, providing benefits such as improved productivity, reduced energy consumption, and the production of coatings with desirable properties like scratch resistance and chemical durability.

The major global manufacturers of Radiation Curable Coatings include Royal DSM, AkzoNobel, IGP Pulvertechnik, Sika, Henkel, PPG, Sherwin Williams, Axalta Coating Systems, Cardinal Paint, Red Spot, Dymax Corporation, SDC Technologies, T&K
