Research Summary

Radio over Fiber (RoF) is a technology that involves the transmission of radio frequency (RF) signals over optical fiber networks. It is widely used in telecommunications and wireless communication systems to extend the reach of RF signals and leverage the benefits of optical fiber, such as high bandwidth, low signal loss, and immunity to electromagnetic interference. In a typical RoF system, the RF signals are converted into optical signals using a transmitter, transmitted over the optical fiber, and then converted back to RF signals at the receiving end using a photodetector. This technology is employed in various applications, including distributed antenna systems (DAS), mobile communication networks, and broadband wireless access, to enhance signal quality, coverage, and capacity. Radio over Fiber is valued for its ability to efficiently transport RF signals over long distances while maintaining signal integrity, making it a key technology in the evolution of advanced wireless communication networks.

The major global suppliers of Radio Over Fiber include Finisar, Huber+Suhner, RF Optic, Emcore, APIC Corporation, Syntronics, ViaLite, DEV Systemtechnik, Foxcom,
