Research Summary

A radiopharmaceutical injector is a medical device used to administer radiopharmaceuticals, which are radioactive compounds used in nuclear medicine imaging and therapy procedures. These injectors are specifically designed to safely and accurately deliver precise doses of radiopharmaceuticals into the patient's bloodstream or targeted tissue. Radiopharmaceutical injectors typically consist of a syringe or vial containing the radiopharmaceutical, a programmable injector pump or mechanism, and a sterile delivery system such as tubing and needles. The injector is programmed to control the injection rate, volume, and timing according to the specific requirements of the imaging or therapeutic procedure. Radiopharmaceutical injectors play a crucial role in nuclear medicine procedures such as positron emission tomography (PET), single-photon emission computed tomography (SPECT), and targeted radionuclide therapy, enabling accurate diagnosis and treatment of various medical conditions including cancer, cardiovascular diseases, and neurological disorders.

The major global manufacturers of Radiopharmaceutical Injector include Medrad,
