Research Summary

Radiotherapy, also known as radiation therapy, is a medical treatment that uses high doses of ionizing radiation to target and destroy or damage cancer cells. The primary goal of radiotherapy is to prevent the growth and division of cancer cells while minimizing damage to nearby healthy tissues. It is a common and effective treatment modality for various types of cancer and may be used as a primary treatment, in combination with surgery or chemotherapy, or to alleviate symptoms in advanced stages of the disease. Radiotherapy can be delivered externally using a machine that directs radiation beams towards the tumor (external beam radiotherapy) or internally by placing radioactive sources directly into or near the tumor (brachytherapy). Precise planning and advanced technologies, such as intensity-modulated radiation therapy (IMRT) and stereotactic radiosurgery, help target tumors more accurately while sparing surrounding healthy tissues. The ultimate aim of radiotherapy is to contribute to the control or elimination of cancer, improve patient outcomes, and enhance the quality of life for individuals undergoing cancer treatment.

The major global manufacturers of Radiotherapy include Varian Medical Systems,
