Research Summary

Raman spectroscopy is a non-destructive analytical technique used to study vibrational, rotational, and other low-frequency modes in a system. Named after Sir C.V. Raman, who discovered the Raman effect in 1928, the technique involves shining a monochromatic light source, usually laser light, onto a sample. The scattered light undergoes a frequency shift corresponding to the vibrational energy levels of the molecular bonds within the sample. By analyzing the shifts in the scattered light spectrum, information about the chemical composition, molecular structure, and bonding arrangements of the sample can be obtained. Raman spectroscopy is widely utilized in various scientific disciplines, including chemistry, biology, and materials science, for applications such as identifying molecules, characterizing materials, and studying biological samples without the need for extensive sample preparation.

The major global manufacturers of Raman Spectroscopy include Horiba, Thermo, Renishaw, B&W Tek, Bruker, Kaiser Optical, WITec, Ocean Insight, Smiths Detection, JASCO, Agilent Technologies, TSI, Real Time Analyzers, Zolix, Sciaps, GangDong SCI.
