### Research Summary

Rapid Oral Fluid Screening Devices are diagnostic tools designed for the quick and on-site detection of various substances in a person's oral fluid, commonly known as saliva. These devices are used for substance abuse testing, including the detection of drugs such as cannabinoids, opioids, amphetamines, and other substances. The testing process typically involves collecting a saliva sample using a swab or collection device and then analyzing the sample on the screening device. The results are usually available within a short timeframe, making these devices convenient for immediate testing in scenarios such as workplace drug testing, law enforcement, or clinical settings. Rapid oral fluid screening devices provide a non-invasive alternative to urine or blood testing and can contribute to timely decision-making regarding substance use. However, confirmatory testing using more specific methods may be necessary for definitive results in certain situations.
