Research Summary

A rectifier diode is a semiconductor device designed to rectify alternating current (AC) by allowing current to flow in one direction only. It is a type of diode that facilitates the conversion of AC to direct current (DC) in electronic circuits. The rectifier diode operates by permitting the flow of current when the voltage applied across its terminals is in the forward direction, and it blocks current when the voltage is in the reverse direction. This one-way current flow is essential in converting the alternating voltage to a pulsating direct voltage. Rectifier diodes are commonly used in power supply circuits, converting the alternating voltage from the electrical grid into a smoother DC voltage suitable for powering electronic devices and systems. They play a fundamental role in various electronic applications, ensuring a unidirectional flow of current for efficient power conversion.

The major global manufacturers of Rectifier Diode include Toshiba, Rohm, Vishay, Pan Jit International, ST Microelectronics, NXP, RENESAS, ON Semiconductor, Diodes Inc., Infineon, Good-Ark, Sanken Electronic, Yangzhou Yangjie, BOURNS, Panasonic,
