Research Summary

A Reduced Pressure Zone (RPZ) backflow preventer is a mechanical device used in plumbing systems to protect potable water supplies from contamination due to backflow. Backflow occurs when the direction of water flow reverses, potentially allowing non-potable water to enter the clean water supply. The RPZ backflow preventer consists of two independently acting check valves separated by a reduced pressure zone and a relief valve. This design helps to ensure that in the event of a pressure drop in the supply line, water from the contaminated system cannot flow backward into the public water supply. RPZ backflow preventers are crucial components in preventing cross-connections and maintaining the safety of drinking water in various settings, including industrial facilities, irrigation systems, and commercial buildings. Regular testing and maintenance of RPZ backflow preventers are essential to verify their proper functioning and compliance with water safety regulations.
