Research Summary

Redundant Array of Independent Disks (RAID) is a storage technology that combines multiple physical disk drives into a single logical unit to improve performance, reliability, or a combination of both. There are several RAID levels, each offering different benefits. Common RAID levels include RAID 0, which focuses on performance by striping data across multiple drives; RAID 1, which provides redundancy by mirroring data on two drives; and RAID 5, which combines striping with parity for a balance of performance and fault tolerance. RAID is widely used in data storage systems to enhance data protection, increase fault tolerance, and optimize input/output performance. It is commonly employed in servers, network-attached storage (NAS), and other storage solutions where data integrity and accessibility are critical.

The major global suppliers of Redundant Array of Independent Disks (RAID) include Broadcom(Avago Technologies), Intel, Dell, Fujitsu, HP, IBM, Lenovo, Microsemi, Areca Technology Corporation, Supermicro, etc. The global players competition landscape in
