Research Summary

Refinery catalysts are substances used in the refining of crude oil to enhance the efficiency and selectivity of various refining processes. These catalysts play a crucial role in accelerating chemical reactions and facilitating the conversion of crude oil into valuable products like gasoline, diesel, and other refined petroleum products. Common refinery catalysts include those used in catalytic cracking, hydrotreating, hydrocracking, and isomerization processes. They function by promoting specific chemical reactions, improving product yields, and enhancing the overall performance of refining units. Refinery catalysts are essential for maximizing the production of high-quality fuels while minimizing undesirable by-products and environmental impact. Continuous research and development in catalyst technology contribute to the optimization of refining processes, ensuring the economic and sustainable production of refined products in the oil and gas industry.

The major global manufacturers of Refinery Catalyst include Grace Catalysts Technologies, BASF, Albemarle, Criterion, Johnson Matthey, Haldor Topsoe, UOP
