Research Summary

Refractive surgery is a type of surgical procedure aimed at correcting common vision problems, such as nearsightedness (myopia), farsightedness (hyperopia), and astigmatism. The goal of refractive surgery is to reduce or eliminate the need for eyeglasses or contact lenses by reshaping the cornea or, in some cases, by implanting intraocular lenses. One of the most common forms of refractive surgery is laser eye surgery, such as LASIK (Laser-Assisted In Situ Keratomileusis), where a laser is used to precisely reshape the cornea to improve the eye's ability to focus light. Other procedures include PRK (Photorefractive Keratectomy) and SMILE (Small Incision Lenticule Extraction). Refractive surgery has become increasingly popular due to its effectiveness and the convenience it offers to individuals seeking freedom from corrective lenses. However, the suitability of refractive surgery depends on various factors, and consultation with an eye care professional is essential to determine candidacy and potential risks.
