Research Summary

Refrigerators are essential household appliances designed for the storage and preservation of perishable food items at low temperatures, preventing spoilage and extending their shelf life. These appliances operate on the principle of vapor compression refrigeration, using a refrigerant to absorb heat from the interior of the fridge and expel it to the external environment. Refrigerators typically consist of compartments with adjustable temperature controls to cater to different storage needs, including fresh produce, meats, dairy products, and frozen items. They often feature additional components like ice makers and water dispensers.
