Research Summary

A regenerated cellulose membrane is a type of membrane made from cellulose, a natural polymer derived from plant sources such as wood pulp or cotton. The regeneration process involves dissolving cellulose in a solvent, forming a solution that can be cast into a membrane and then regenerated by precipitation in a non-solvent bath. This process results in a porous membrane with a structure that allows for selective permeation of certain substances. Regenerated cellulose membranes are widely used in various applications, including ultrafiltration, microfiltration, and dialysis, where precise separation of particles or molecules based on size or other characteristics is essential. These membranes are valued for their biocompatibility, high permeability, and the ability to be tailored for specific separation tasks in industries such as pharmaceuticals, food and beverage, and water treatment.

The major global manufacturers of Regenerated Cellulose Membrane include Futamura Chemical, Shandong Henglian New Materials, Shaoxing Chunming Cellulose Film, Hubei Golden Ring, Yibin Grace, etc. The global players competition landscape in this
