Research Summary

In the context of a Smart Grid, a Remote Terminal Unit (RTU) is a key component of the supervisory control and data acquisition (SCADA) system. The RTU serves as an interface between field devices, such as sensors and actuators located in the electrical grid infrastructure, and the central SCADA system. It collects real-time data from various points within the power distribution network, monitoring parameters like voltage, current, and equipment status. The RTU then transmits this data to the SCADA master station, enabling operators to remotely monitor, control, and manage the Smart Grid. RTUs play a crucial role in enhancing the efficiency, reliability, and responsiveness of the electrical grid by facilitating real-time data acquisition and control capabilities, contributing to the overall intelligence and automation of modern power systems.
