Research Summary

Reticle stockers are automated storage systems used in semiconductor manufacturing facilities to store and manage reticles, also known as photomasks. These systems are designed to provide a controlled and clean environment for the storage of reticles, which are crucial for the photolithography process in semiconductor fabrication. Reticle stockers typically consist of robotic arms and shelves that can house multiple reticles in a secure manner. The automation of reticle storage helps prevent contamination and damage, ensuring the integrity of the reticles before they are used in the semiconductor production line. These stockers often integrate with the overall semiconductor manufacturing equipment and control systems, allowing for efficient retrieval and loading of reticles based on the production requirements. The use of reticle stockers contributes to improved process reliability, reduced downtime, and enhanced overall wafer yield in semiconductor manufacturing.

The major global manufacturers of Reticle Stockers include Brooks, Murata Machinery, DAIFUKU, Dan-Takuma Technologies, Seminet, etc. The global players competition
