Research Summary

A retimer, often referred to as a redriver, is an electronic device used in data communication systems to enhance and recover signal integrity. It is particularly employed in high-speed data transmission scenarios where signals may experience degradation due to factors like attenuation and jitter. The retimer receives incoming signals, reshapes them, and then retransmits them to ensure that the data integrity is restored. This is crucial in applications such as high-speed serial data links, where maintaining signal quality is essential for reliable data transfer. Retimers are commonly used in various communication interfaces like PCIe (Peripheral Component Interconnect Express), USB (Universal Serial Bus), and other high-speed interconnects to extend the reach of data links and overcome signal degradation challenges over long distances or through various components in a system.

The major global manufacturers of Retimer include Texas Instrument, NXP Semiconductors, Intel, Renesas Electronics, Diodes Incorporated, Analogix, Parade Technologies, Microchip Technology, THine Electronics, Montage Technology, Astera Labs, etc. The global players competition landscape in this report is divided into three
