Research Summary

RFID (Radio Frequency Identification) inlays are the core components of RFID tags, designed to enable wireless communication between the tag and a reader. These inlays consist of a microchip and an antenna, which are typically embedded within a substrate material, such as paper, plastic, or fabric. The microchip stores data, while the antenna transmits and receives radio signals to and from the RFID reader, enabling the identification, tracking, and management of assets, products, or inventory. RFID inlays are used in a wide range of applications, including supply chain management, retail inventory tracking, access control, and contactless payment systems. Their ability to provide automatic, real-time data capture without requiring direct line-of-sight makes them highly efficient for improving operational accuracy, reducing manual errors, and enhancing asset visibility in various industries.

The major global manufacturers of RFID Inlays include Avery Dennison, SML Group, Trimco Group, Checkpoint Systems, Beontag, Arizon, XINDECOIOT, Tageos, SATO, INLAYLINK, Zebra, NAXIS, Hangzhou Century Co., Ltd, Talkin' Things, Hana Technologies, Invengo, etc. The global players competition landscape in this report is
