Research Summary

Rhenium (Re) evaporation materials are high-purity forms of rhenium used in physical vapor deposition (PVD) processes to create thin films and coatings. Rhenium, a refractory metal with a very high melting point (3180°C) and excellent thermal stability, is ideal for applications requiring durable, high-temperature-resistant coatings. These materials are available in various forms, such as pellets, granules, rods, or wires, tailored for specific evaporation techniques. During the PVD process, rhenium evaporation materials are heated in a vacuum to their sublimation point, where they vaporize and then condense on a substrate, forming a uniform thin film. This technique is commonly employed in the electronics, aerospace, and optics industries to enhance surface properties, including hardness, corrosion resistance, and conductivity. The superior properties of rhenium coatings make them essential for high-performance components exposed to extreme environments.
