Research Summary

Rhenium is a rare and dense transition metal with the chemical symbol Re and atomic number 75. It belongs to Group 7 of the periodic table. Rhenium is characterized by its high melting point, exceptional resistance to wear and corrosion, and unique combination of properties. It is one of the rarest elements in the Earth's crust and is often found in association with other metals, such as molybdenum and copper. Rhenium is primarily used as an alloying agent in the production of superalloys, which are essential for high-temperature applications, such as in jet engines and industrial processes. It is also employed in the production of certain catalysts, thermocouples, and electrical contacts. Due to its scarcity and specialized applications, rhenium is considered one of the more exotic and valuable elements in the periodic table.

The major global manufacturers of Rhenium include Molymet, Freeport MCMoRan, KGHM, KAZ Minerals, LS-Nikko, Biosynth Carbosynth, Jiangxi Copper, Glentham Life Sciences, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong

competitiveness and influence, and generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
