Research Summary

A Ring Laser Gyroscope (RLG) is a highly sensitive and accurate inertial navigation device used for measuring angular rotation rates. It operates on the principles of interferometry and laser optics. In an RLG, laser beams are split into two counter-propagating paths within a closed loop or ring cavity. As the gyroscope rotates, a phase shift occurs between the two laser beams due to the Sagnac effect, which is proportional to the rotation rate. This phase shift is then measured to determine the angular velocity of the gyroscope. Ring Laser Gyroscopes are known for their precision and are commonly used in navigation systems for aircraft, spacecraft, and other platforms requiring accurate and stable orientation information. They offer advantages such as high sensitivity, reliability, and the absence of moving parts, making them essential in various aerospace and defense applications.

The major global manufacturers of Ring Laser Gyroscope (RLG) include Honeywell, Safran, Northrop Grumman, Kearfott Corporation, Polyus, AVIC, JAE, MIEA JSC, Inertial Technologies JSC, Beifang Jierui, etc. The global players competition landscape
