Research Summary

A roller bearing is a mechanical component used to reduce friction between moving parts and support rotational or linear motion in machinery and equipment. It consists of an outer race, an inner race, and cylindrical or spherical rolling elements known as rollers, which are typically made of steel or ceramic materials. The rollers are held in place by cages or retainers and are positioned between the inner and outer races. Roller bearings are designed to accommodate radial, axial, or combined loads and can operate at high speeds with minimal friction and wear. They come in various configurations, including cylindrical, tapered, spherical, and needle roller bearings, each suited to specific applications and load conditions. Roller bearings are widely used in industries such as automotive, aerospace, industrial machinery, and power generation to support shafts, axles, and other rotating or linear components, providing smooth and efficient motion while minimizing maintenance requirements.

The major global manufacturers of Roller Bearing include SKF, Schaeffler, NSK, NTN, JTEKT, Timken, C&U, LYC, Nachi, NMB, TMB, ZWZ, RBC Bearings, HRB, ZXY,
