Research Summary

Roof decking refers to the structural layer or substrate that provides support and stability for the roof covering materials, such as shingles, tiles, or metal panels. It is typically made of wood, plywood, oriented strand board (OSB), or metal, and is installed directly over the roof framing members, such as trusses or rafters. Roof decking serves as a solid base for attaching the roof covering, distributing the weight of the materials evenly across the roof structure and helping to prevent sagging or distortion.

Additionally, roof decking plays a crucial role in protecting the building interior from water infiltration, providing a barrier against moisture and weather elements. Depending on the specific requirements of the roofing system and local building codes, roof decking may be supplemented with additional layers, such as underlayment or insulation, to enhance performance and durability. Overall, roof decking is an essential component of the roofing assembly, providing structural support and ensuring the integrity and longevity of the roof.
