Research Summary

A roots blower, also known as a rotary lobe blower or a positive displacement blower, is a mechanical device used for compressing gases or air by displacing them through a series of rotating lobes. It operates on the principle of positive displacement, where the lobes trap and transfer a fixed volume of gas or air from the inlet to the outlet side of the blower with each rotation. Roots blowers consist of two counter-rotating lobes housed within a casing, with clearances maintained between the lobes and the casing to prevent direct contact. As the lobes rotate, they create a continuous flow of gas or air, generating pressure and delivering it to the system. Roots blowers are commonly used in various industrial applications such as pneumatic conveying, wastewater treatment, aeration, and vacuum systems, where high flow rates and moderate compression ratios are required. They are known for their reliability, durability, and efficiency, making them a popular choice for providing consistent and reliable air or gas supply in industrial processes.

The major global manufacturers of Roots Blower include Gardner Denver, Dresser(GE), Tuthill Corporation, Howden, Aerzen, Taiko, Anlet, Unozawa, ITO, Shandong Zhangqiu
