Research Summary

Rotary pressure filters are specialized filtration systems used in various industries for the continuous separation of solids and liquids from slurries or suspensions. These filters consist of a rotating drum or disc-shaped filter media, typically made of wire mesh or perforated metal, enclosed within a pressure vessel. As the suspension is fed into the vessel, pressure is applied to force the liquid through the filter media, leaving behind the solid particles on the surface. The rotating filter media continuously advances the solids towards the discharge zone, where they are scraped or washed off the surface and collected for further processing. Rotary pressure filters offer advantages such as high throughput, continuous operation, and efficient cake washing, making them ideal for applications requiring solid-liquid separation, such as chemical processing, pharmaceuticals, mining, and wastewater treatment. They provide a reliable and cost-effective solution for achieving high-purity filtrate and dry filter cakes with minimal operator intervention.

The major global manufacturers of Rotary Pressure Filters include BHS, ANDRITZ,

Gneuss, BOKELA, Juneng Machinery Group, NEOTECHS, Hefei Tiangong Science & Technology, etc. The global players competition landscape in this report is divided into three tiers.
