Research Summary

In carbon and alloy steels, the terms 'round' and 'square' basis refer to the method of specifying the chemical composition of the material. The round basis indicates that the chemical composition is expressed as the average carbon content for a batch or heat of steel, typically rounded to the nearest hundredth or tenth of a percent. This method provides a broad overview of the steel's composition but may not accurately represent the actual content of individual specimens within the batch. Conversely, the square basis specifies the minimum and maximum carbon content allowed within a batch or heat of steel, providing a tighter range and ensuring greater consistency in the material's properties. While both methods have their advantages, the square basis is often preferred for applications requiring precise control over the carbon content and mechanical properties of the steel.

The major global manufacturers of Round and Square Basis in Carbon and Alloy Steels include Beltrame, ArcelorMittal, RIVA, Celsa Group, Salzgitter, Voestalpine, British
