### Research Summary

Rubber crumbs, also known as rubber granules or crumb rubber, are recycled rubber materials produced by shredding or grinding scrap rubber, such as discarded tires or rubber products, into small particles. These rubber crumbs are commonly used as infill material in sports surfaces, playgrounds, and synthetic turf fields, as well as in various construction applications such as road paving and noise barriers. Natural rubber, on the other hand, is a renewable and highly elastic material derived from the latex of rubber trees. It is widely used in the production of tires, automotive components, industrial goods, and consumer products due to its excellent mechanical properties, resilience, and resistance to abrasion and tearing. While rubber crumbs and natural rubber serve different purposes and are derived from different sources, both contribute to sustainable practices by extending the lifecycle of rubber materials and reducing environmental waste.
