Research Summary

SAR (Specific Absorption Rate) Measurement Systems are specialized equipment used to assess the amount of radiofrequency (RF) energy absorbed by the human body when exposed to electromagnetic fields, particularly from wireless devices such as cell phones, tablets, and wireless routers. These systems typically consist of calibrated antennas, phantoms mimicking the human body, RF signal generators, power meters, and specialized software for data analysis. SAR Measurement Systems adhere to international standards and regulations, such as those set by the Federal Communications Commission (FCC) in the United States, to ensure that RF exposure levels from electronic devices remain within safe limits and do not pose health risks to users. By accurately measuring SAR, these systems help manufacturers and regulatory authorities assess and certify the safety of wireless devices before they are released into the market, thereby ensuring consumer protection and public health.

The major global manufacturers of SAR Measurement Systems include SPEAG, Microwave Vision Group, ART-Fi, IndexSAR, TDK RF Solutions, etc. The global players
