Research Summary

A satellite antenna, also known as a satellite dish or parabolic antenna, is a specialized device used to receive or transmit radio signals to and from satellites in orbit around the Earth. Typically consisting of a concave dish-shaped reflector and a feedhorn at the focal point, satellite antennas are designed to focus radio waves onto the feedhorn, which is connected to a receiver or transmitter. The dish reflects incoming signals from the satellite onto the feedhorn for reception, or it focuses signals from the feedhorn onto the satellite for transmission. Satellite antennas are commonly used for receiving television broadcasts, internet services, satellite phone communications, and data transmission from satellites in geostationary or low Earth orbits. They vary in size and design depending on the application, frequency band, and satellite orbit, with larger antennas typically providing higher gain and better signal reception.

The major global manufacturers of Satellite Antenna include Maxar Technologies, Viasat, Honeywell International, Mitsubishi Electric Corporation, L3Harris, CPI Satcom & Antenna Technologies, Cobham Limited, Kymeta, Gilat Satellite Networks, Norsat

International, ThinKom, Elite Antennas, etc. The global players competition landscape in this report is divided into three tiers.
