Research Summary

A scanning rangefinder is a sensor device that measures distances to objects by emitting a laser or infrared beam and then calculating the time it takes for the beam to reflect back to the sensor. These rangefinders utilize scanning mechanisms to sweep the emitted beam across a field of view, enabling them to capture distance measurements to multiple points within their range. By analyzing the reflected signals, scanning rangefinders can determine the distances to various objects in their surroundings with high accuracy and precision. These devices find applications in robotics, autonomous vehicles, surveying, mapping, and 3D modeling, where accurate spatial information about the environment is essential for navigation, obstacle avoidance, and scene reconstruction.

The major global manufacturers of Scanning Rangefinder include Valeo, SICK AG, Hokuyo Automatic, Shenzhen Robo Sense Technology, Hesai Technology, Velodyne Lidar, Pepperl+Fuchs SE, Ouster, Inc., VanJee Technology, Shenzhen Leishen Intelligence System, SureStar, etc. The global players competition landscape in this
