### Research Summary

SDS-PAGE, or Sodium Dodecyl Sulfate Polyacrylamide Gel Electrophoresis, is a widely used technique in biochemistry and molecular biology to separate proteins based on their molecular weight. In SDS-PAGE, proteins are denatured by boiling in the presence of a strong anionic detergent called SDS, which coats the proteins with a negative charge and unfolds them into linear chains. The proteins are then loaded onto a polyacrylamide gel matrix along with a tracking dye. When an electric current is applied, the proteins migrate through the gel according to their size, with smaller proteins moving faster and larger proteins moving more slowly. After electrophoresis, the gel is typically stained with a dye that binds to the proteins, making them visible. SDS-PAGE is commonly used for analyzing protein purity, determining molecular weight, and separating proteins for further analysis or purification. It's a foundational technique in biochemistry laboratories and is essential for various research applications, including protein biochemistry, molecular biology, and diagnostics.

The major global suppliers of SDS-PAGE include Bio-Rad Laboratories, General Electric, Merck, Thermo Fisher Scientific, Rockland Immunochemicals, GenScript,

Abcam, Cleaver Scientific, Hycult Biotech, Amneal pharmaceutical, Accord Healthcare, Aurobindo Pharma, Allan Chemical Corporation, Samirian Chemicals, Ampak Chemicals, Noah Technologies Corporation, Dastech International, Sun Pharmaceutical Industries, etc. The global players competition landscape in this report is divided into three tiers.
