### Research Summary

A seawater battery is a type of rechargeable battery that utilizes the chemistry of seawater as an electrolyte to generate electrical energy. These batteries typically employ a metal electrode (e.g., magnesium or aluminum) as the anode and a cathode made of a different metal or alloy. When immersed in seawater, the anode undergoes oxidation, releasing electrons, while the cathode undergoes reduction, accepting these electrons, thereby creating an electric current. Seawater batteries are appealing due to their potential for environmentally friendly energy storage, as seawater is abundant and readily available. Moreover, they offer potential applications in marine environments and coastal regions, such as powering sensors, buoys, and other oceanographic instruments, as well as providing backup power for offshore installations or remote coastal communities. Additionally, research continues to explore ways to enhance the efficiency, longevity, and scalability of seawater batteries for broader energy storage applications.

The major global manufacturers of Seawater Battery include Bluesky Energy, Shenzhen

Sea Energy Power Holding, etc. The global players competition landscape in this report is divided into three tiers.
