### Research Summary

A seed is a small, embryonic plant enclosed within a protective outer covering, designed to facilitate reproduction and growth in plants. It contains all the necessary components for the development of a new plant, including the embryo, a food reserve (endosperm or cotyledons), and a seed coat for protection. Seeds are the result of sexual reproduction in seed-bearing plants and are formed following the fertilization of an ovule. They vary widely in size, shape, and dispersal mechanisms, enabling plants to adapt to different environments. Seeds play a critical role in agriculture, ecology, and biodiversity, serving as the primary means of propagating crops, sustaining ecosystems, and supporting human and animal life through the production of food, feed, and raw materials.
