Research Summary

A seismic base isolation system is a structural engineering technique designed to mitigate the effects of seismic forces on buildings and infrastructure by decoupling them from the ground motion generated during earthquakes. These systems typically involve installing isolators, such as bearings or dampers, between the building's foundation and superstructure to absorb and dissipate seismic energy. By allowing the structure to move independently of the ground motion, seismic base isolation systems reduce the transmission of seismic forces and vibrations into the building, thereby minimizing damage and improving structural resilience. Seismic base isolation is widely used in the construction of critical facilities such as hospitals, data centers, and bridges, as well as historic buildings and cultural landmarks, to enhance their earthquake resistance and protect human life and property during seismic events.

The major global manufacturers of Seismic Base Isolation System include Yunnan Quakesafe Seismic, OILES CORPORATION, Kawakin Holdings, Nippon Steel Engineering, SWCC SHOWA, Maurer, Earthquake Protection Systems, Bridgestone,
