Research Summary

Self-driving cars, also known as autonomous vehicles, are automobiles equipped with advanced sensors, cameras, radar, and artificial intelligence (AI) technology that enable them to navigate and operate on roads without human intervention. These vehicles use a combination of sensors and real-time data processing to perceive their surroundings, identify obstacles, interpret traffic signs and signals, and make driving decisions such as accelerating, braking, and steering. Self-driving cars are categorized into different levels of automation, ranging from Level 0 (no automation) to Level 5 (full automation), with Level 5 vehicles capable of operating autonomously in all driving conditions without human intervention. The development of self-driving cars holds the potential to revolutionize transportation by improving road safety, reducing traffic congestion, and enhancing mobility for individuals with disabilities or limited access to transportation options. However, challenges such as regulatory hurdles, technological limitations, and public acceptance remain significant barriers to widespread adoption.
