### Research Summary

Self-expanding stents are medical devices used to treat narrowed or blocked blood vessels, typically arteries, by providing structural support to keep the vessel open and maintain adequate blood flow. These stents are made of a metal alloy, such as stainless steel or nitinol, and are designed to be compressed for insertion into the vessel and then expand gradually to their intended diameter once deployed at the target site. The self-expanding nature of these stents allows them to conform to the shape and size of the blood vessel, ensuring proper placement and reducing the risk of complications such as stent migration or restenosis. Self-expanding stents are commonly used in endovascular procedures to treat conditions such as coronary artery disease, peripheral artery disease, and other vascular disorders, providing a minimally invasive alternative to traditional surgical interventions.

The major global manufacturers of Self-Expanding Stents include Boston Scientific, Medtronic, Cook, Becton & Dickinson, Abbott, Terumo, Cordis, Biotronik, Gore, etc. The global players competition landscape in this report is divided into three tiers. The first
