Research Summary

Self-healing concrete is an innovative type of concrete designed to automatically repair cracks that form over time, enhancing its durability and lifespan. It incorporates special healing agents, such as bacteria, capsules, or microfibers, that are embedded within the concrete mix. When cracks develop and water or air infiltrates, these agents are activated, triggering chemical reactions that fill the cracks with a healing material, such as calcium carbonate or other mineral deposits. This self-repairing process helps to maintain the structural integrity of the concrete, reduce maintenance costs, and extend the life of infrastructure like roads, bridges, and buildings. Self-healing concrete is especially beneficial in harsh environments where regular maintenance is challenging, making it a promising advancement in sustainable construction materials.

The major global manufacturers of Self-healing Concrete include Basilisk, Xypex Chemical, JP Concrete, Penetron, Ecomix, Enzymatic, Kunming Jinghuo Biotechnology, etc. The global players competition landscape in this report is divided into three tiers.
