Research Summary

A semiconductor lead frame is a crucial component used in the packaging of semiconductor devices, providing a structural support and electrical connections for integrated circuits (ICs) during assembly. Typically made of a metal alloy such as copper, nickel, or iron, lead frames feature a grid-like structure with multiple leads or pins arranged around the edges, serving as pathways for electrical signals to enter and exit the packaged IC. During the assembly process, semiconductor dies are attached to the lead frame, and fine wire bonds connect the die's bond pads to the leads. The lead frame also acts as a heat sink, dissipating heat generated by the IC during operation to ensure optimal performance and reliability. Semiconductor lead frames are essential in facilitating the mass production of semiconductor devices, offering cost-effective solutions for packaging while maintaining electrical connectivity and thermal management.

The major global manufacturers of Semiconductor Lead Frame include Mitsui High-tec, Shinko, Chang Wah Technology, Advanced Assembly Materials International,
