Research Summary

A semiconductor probe station is a highly specialized piece of equipment used in semiconductor testing and characterization. It consists of a precisely controlled platform where semiconductor devices, typically individual integrated circuits (ICs) or chips, can be mounted and electrically probed for performance evaluation. These probe stations feature micromanipulators equipped with fine probes that make contact with specific points on the device under test, allowing for precise measurements of electrical parameters such as voltage, current, and resistance. Semiconductor probe stations are commonly used during the development and production phases of semiconductor devices to validate their functionality, verify performance specifications, and identify defects. They play a critical role in ensuring the quality and reliability of semiconductor products before they are integrated into electronic systems.
