Research Summary

Semiconductor sealing products are specialized materials used in semiconductor packaging to encapsulate and protect delicate semiconductor devices from environmental factors such as moisture, contaminants, and mechanical stress. These sealing products typically consist of epoxy resins, silicone elastomers, or other polymers formulated with additives to optimize properties such as adhesion, thermal conductivity, and moisture resistance. Semiconductor sealing products are applied to semiconductor packages through processes such as molding, dispensing, or film lamination, creating a protective barrier around the packaged device. This barrier shields the semiconductor components from external factors that could degrade their performance or reliability, ensuring the long-term functionality and integrity of semiconductor devices in various electronic applications.
