Research Summary

Serpentine is a metamorphic rock primarily composed of serpentine minerals formed through the alteration of ultramafic rocks such as peridotite or pyroxenite in the presence of water and high temperatures. This alteration process, known as serpentinization, results in the replacement of original minerals with serpentine, which gives serpentine its characteristic green color and waxy to greasy texture. Serpentine often exhibits a scaly or fibrous appearance due to the fibrous nature of serpentine minerals. It is commonly found in areas of tectonic activity, such as subduction zones, where oceanic crust is subjected to high pressures and temperatures. Serpentine has various applications in construction, architecture, and industry, including as a decorative stone, in building materials, and as a source of magnesium and other minerals. Additionally, serpentine plays a role in geologic processes such as carbon sequestration and the cycling of elements in the Earth's lithosphere.

The major global manufacturers of Serpentine include Jiacheng, Huixiang, Baoxin, Liangshuo, Panda, Xinyuan, Honfoo, Pedras Congonhas, Southland Serpentine Ltd,

Dundas Extended Minerals, etc. The global players competition landscape in this report is divided into three tiers.
