### Research Summary

A service mesh is a dedicated infrastructure layer that facilitates communication, management, and control between microservices within a distributed application architecture. It acts as a configurable communication infrastructure that provides features such as service discovery, load balancing, traffic routing, encryption, authentication, and monitoring. Service meshes typically utilize sidecar proxy instances deployed alongside each microservice to intercept and manage traffic, allowing for fine-grained control over communication patterns and behavior without modifying the application code. This architecture enhances observability, resilience, and security in complex microservices-based deployments, enabling organizations to efficiently manage and scale their applications while ensuring reliability and performance across diverse environments such as on-premises data centers, cloud platforms, and hybrid infrastructures.
