### Research Summary

Shakers, sieves, and screens are essential tools used in various industries for particle size analysis, separation, and classification of materials. Shakers, often referred to as sieve shakers, are mechanical devices that apply oscillating or gyratory motion to a stack of sieves containing the material to be analyzed. This motion causes particles to move and pass through the openings in the sieves, separating them according to their size. Sieves are meshed screens with precise openings of different sizes, allowing particles smaller than the openings to pass through while retaining larger particles. Screens, on the other hand, are flat or curved surfaces with perforations or mesh that serve similar purposes but may be used in different applications or configurations. These tools are widely employed in industries such as pharmaceuticals, food processing, mining, agriculture, and construction to ensure product quality, consistency, and compliance with regulatory standards by accurately determining particle size distribution and removing unwanted contaminants or impurities.
