Research Summary

Shale gas hydraulic fracturing, commonly known as fracking, is a technique used to extract natural gas from shale rock formations deep underground. The process involves drilling a well vertically and then horizontally into the shale layer. Next, a mixture of water, sand, and chemicals is pumped into the well at high pressure, causing the shale rock to fracture. These fractures create pathways for the trapped natural gas to flow more freely to the surface, where it can be captured and collected. Hydraulic fracturing has revolutionized the energy industry by unlocking vast reserves of previously inaccessible natural gas. However, it has also raised significant environmental concerns, including potential contamination of groundwater, air pollution, and induced seismic activity. As a result, the practice remains highly controversial, with ongoing debates about its long-term sustainability and environmental impact.

The major global manufacturers of Shale Gas Hydraulic Fracturing include Halliburton, Schlumberger, Baker Hughes, BJ Energy Solutions, Stewart & Stevenson, Jereh, Sinopec Oilfield Equipment Corporation, Baoji Oilfield Machinery Co., Ltd., SANY,

Honghua Group, TotalEnergies, etc. The global players competition landscape in this report is divided into three tiers.
