Research Summary

A ship exhaust gas scrubber, also known as a marine scrubber, is an environmental protection device installed on ships to reduce air pollution emissions from marine engines, particularly sulfur oxides (SO_x) and particulate matter. These scrubbers work by using a combination of water or alkaline solutions to neutralize and remove harmful pollutants from the exhaust gases emitted by the ship's engines. The process involves injecting the scrubbing solution into the exhaust stream, where it reacts with sulfur oxides and other pollutants to form harmless compounds or solids that can be safely discharged into the sea or collected for proper disposal. Ship exhaust gas scrubbers are increasingly adopted by maritime operators to comply with international regulations, such as the International Maritime Organization's (IMO) sulfur emission control requirements, which aim to reduce the environmental impact of shipping activities and mitigate air pollution in coastal areas and sensitive marine ecosystems.
