Research Summary

Ship radar is an essential navigational tool used on vessels for detecting and tracking nearby objects, land masses, and other ships to ensure safe navigation and collision avoidance. It operates by emitting radio waves in a rotating beam that scans the surrounding area, with the radar system then receiving and processing the reflected signals to create a visual representation of the ship's surroundings on a display unit. Ship radar systems provide valuable information such as the distance, bearing, and relative speed of nearby objects, allowing ship operators to make informed decisions in real-time and navigate safely, especially in low visibility conditions such as fog or darkness. Advanced ship radar systems may also incorporate additional features such as automatic target tracking, collision avoidance alarms, and integration with other onboard navigation systems, enhancing situational awareness and operational efficiency for maritime vessels.

The major global manufacturers of Ship Radar include Furuno, Navico, JRC (Alphatron Marine), Garmin, SAM Electronics, Transas Marine International, Raymarine, Raytheon, Sperry Marine, TOKIO KEIKI, GEM Elettronica, Rutter Inc, Koden Electronics, Kelvin
