### Research Summary

Short-moment lidar is a type of lidar (Light Detection and Ranging) technology that utilizes short-duration laser pulses to measure atmospheric parameters such as wind speed, turbulence, and aerosol concentrations with high temporal and spatial resolution. Unlike traditional Doppler lidar systems that use continuous-wave lasers, short-moment lidar systems emit laser pulses with durations on the order of microseconds or less. This allows for rapid sampling of atmospheric conditions, making short-moment lidar particularly useful for capturing short-lived phenomena such as turbulent gusts or boundary layer dynamics. Short-moment lidar finds applications in various fields including meteorology, atmospheric research, wind energy, and aviation, where precise measurements of atmospheric processes are crucial for improving weather forecasting, optimizing wind turbine performance, and enhancing aviation safety.

The major global manufacturers of Short-moment Lidar include Hesai Tech, Robo Sense, LeiShen Intelligence System, Continental, Velodyne, Ouster, Waymo, WHST, etc. The global players competition landscape in this report is divided into three tiers.
