Research Summary

A sifting machine, also known as a sieve shaker or vibratory screener, is a mechanical device used for separating particles of different sizes in granular or powdered materials. It typically consists of a sieve or screen mesh, which vibrates or oscillates to effectively separate particles based on their size and shape. As the material is fed onto the sieve, the vibrations cause smaller particles to fall through the openings in the mesh, while larger particles are retained on the surface. Sifting machines are widely used in various industries such as pharmaceuticals, food processing, agriculture, and mining to ensure product quality, remove impurities, and achieve desired particle size distributions. They come in a range of sizes and configurations to accommodate different throughput requirements and material characteristics, providing efficient and precise particle separation for diverse industrial applications.

The major global manufacturers of Sifting Machine include Russell Finex, Rotex, Buhler, Kason, GEA, Allgaier, Jiangsu Guibao, CUCCOLINI srl, Kemutec, KOWA KOGYOSHO, Sweco, Guan Yu, GKM Siebtechnik, LAO SOUNG, Kroosh Technologies Ltd., Vibrowest,
